MegaTrainer – eXperience Guides

© 2002-2009 MegaDev	Programming: little Muck & CCJ39 http://www.md-trainers.info / http://www.megadev.info	

Team: CCJ39 (Author, Addressing, Programming, Web) / little Muck (Author, Programming, Web) / Mextase (Web, Tester) / Michel325 (Addressing, Web) / HWFlo (Author, Programming, Web, Addressing)

Common: This gametrainer was created only with and for original gameversion. The supported gameversions are shown in the trainer. If there's a new patch for a game we already support, we'll try to update the trainer for this patch as soon as possible, because generally there exists a memory-address-mismatch between different gameversions, through with the trainer isn't working until an update.

Important: Detailed cheat-descriptions for all games are available at www.megadev.info and www.md-trainers.info.

MegaTrainer – eXperience Information

Common: The MegaTrainer – eXperience is a so called gametrainer. A gametrainer is a program which causes different effects in games by defined keys to press. The effect is similiar to the use of cheats, but you don't need to enter commands, but press a special hotkey, which activates the function of the trainer. In contract to cheats, these functions aren't part of the game by the developers. To realize the functions, a gametrainer modifies the memory of the game, but it's necessary the trainer has the needed rights to do it and will not be blocked by antivirus-software or else. As a result of the fact that such memory-modifications cannot be random and must be taken at the right position of each game and version, such gametrainers mostly only work with one special game and gameversion. The MT-X ist different to normal gametrainers, because it's composed of several gametrainers, so the full trainer-project can support many games and gameversions.

First Aid: If the MT-X isn't working, please have a look to the points below

- Verify if your gameversion and lanuguage match the listed one from the trainer (patch your game if needed). You can check it out with MegaChecksum.
- Close all other programs in background (some programs are blocking several hotkeys)
- Configure your antivirus-software, so it's allowed for the MTXL to modify the memory of other programs (games)
- Try the MT-X on other games
- Use the original exe-file of the game and not a modified one (also dll-files in same cases)
- If you're further unable to get the MT-X to work, feel free to contact the support to discover a solution at http://www.megadev.info/ .

Known problems:

Common ~ Some antivirus-programs protect the memory of programs/games in default and/or userdefined settings. In such cases the trainer cannot work until you've configured your AV-program to allow the MT-X to modify games-memory (classify the MT-X as trustable). Known programs in some settings are: Kaspersky, Avant, Antivir.
